

Aquavalve

The **Tru-Design Aquavalve** is designed and made in New Zealand, for demanding marine sanitation applications. The Aquavalve is typically used in marine toilet applications where protection for the environment necessitates the need to control effluent discharge – in many countries this is governed by regulation.

Sewage entering our waterways and oceans has become a problem faced in many areas. With 124 countries now party to MARPOL 73/78 Annex IV for ships, smaller vessels are now being targeted. Legislation in many countries now dictates the use of holding tanks near shore, or in defined areas. By installing a diverting valve, the user has the ability to hold sewage when required by law, and can pump directly overboard when allowed. The Aquavalve has the ability to be locked to comply with local legislation.
